8/1/20 Re: Jason Richards DOB: 7/6/18

Dr. Derek,

Jason was referred to me following development of his initial IFSP with BabyNet to evaluate concerns regarding his seating during family meals and other activities. I evaluated Jason in his home on 7/29/20 so that I could observe his posture, balance and muscle tone during ADLs.

Jason exhibits mild to moderate hypotonia in his trunk, with fixing of his scapula to compensate for trunk instability, and mild to moderate hypotonia in his upper and lower extremities. For pediatric ADLs such as mealtimes, floor play, etc., the status of his muscle tone impacts his ability to independently reach and grasp objects, bring objects to midline, self-feeding, and drink from a cup. While Jason is aware and motivated to attempt these activities, doing so in an unsupported sitting position results in loss of balance and falling.

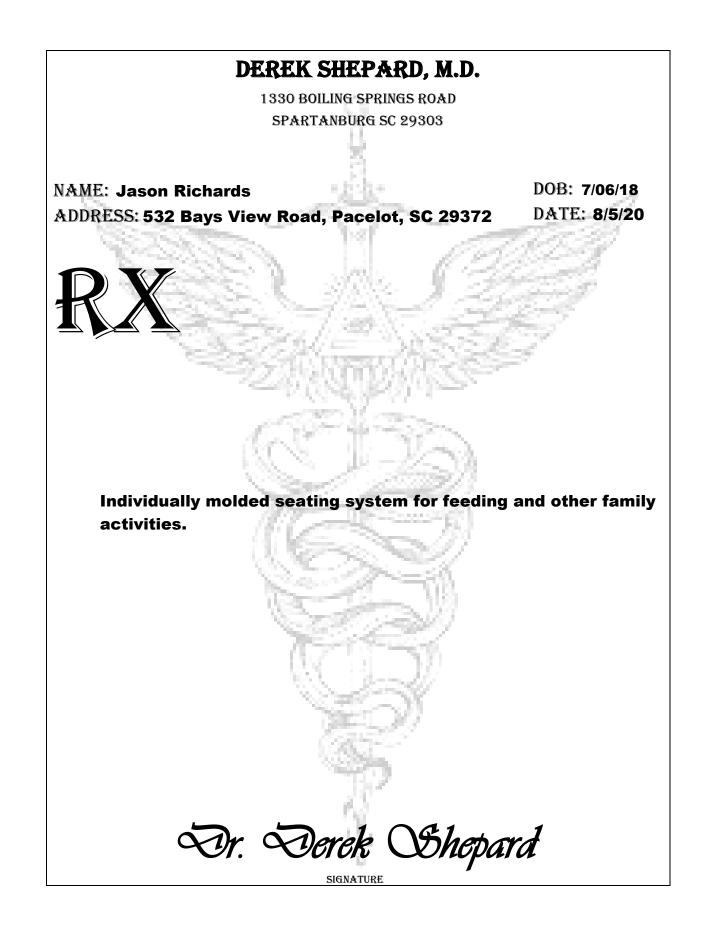

It is recommended that Jason be fitted with an individualized molded seating device that can be used for meals and floor play. Addressing the trunk instability now will give Jason the best chance at continuing to develop his fine motor skills, cognition, hand-eye coordination, and age-appropriate independence with ADLS.

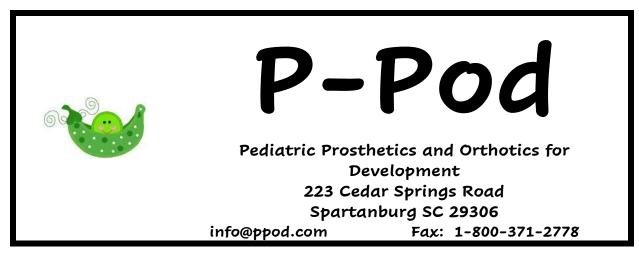

Please feel free to contact me with any questions you have concerning Jason, or my recommendation. I can be reached at the number or e-mail address listed above. Thank you for your consideration of this request.

Sincerely,

Nína Símone

Nina Simone, OTL, MOT Occupational Therapist
